SUMMARY

Full-stack software engineer with 4.5+ years of professional experience building production web apps on **C#/.NET**, **JavaScript/TypeScript/Node** and **Microsoft Azure**. Developed features from prototype to production, from backend to frontend. Later led a six-person team as interim technical team lead. Programming since 2014, and still building projects to learn new tools.

SKILLS

- **Languages:** C#, TypeScript, JavaScript, SQL, HTML, CSS, Python, Java, Rust
- **Backend:** ASP.NET, Node.js, REST APIs, gRPC APIs
- **Frontend:** Vue.js, Nuxt, React, Next.js, Tailwind CSS
- **Data:** Azure Cosmos DB, PostgreSQL, SQLite, Google Analytics, Power BI
- **Testing:** xUnit, Jest, Vitest
- **DevOps:** Microsoft Azure, AWS, CI/CD pipelines, GitHub Actions
- **AI-assisted development:** Claude Code, GitHub Copilot
- **Leadership:** Tech team lead, software architecture, project planning, code review, documentation

EXPERIENCE

The Really Useful Information Company (TRUIC) *February 2019 – October 2023*

Software Engineer → Interim Technical Team Lead

- Built on top of and maintained an internal CMS that powered three public websites (How To Start An LLC, Startup Savant, and truic.com). The CMS uses an ASP.NET backend, a Vue.js frontend, is backed by data on Cosmos DB, and is deployed on Azure App Service.
- Shipped full-stack features from prototype to production. Worked on the database, data model, API endpoints, and frontend UI.
- Built backend services for the public sites and worked on frontend code for their most interactive features, including our business logo generator and business name generator.
- Led a partial move of older JavaScript components to React and TypeScript.
- Handled Azure deployments, scaling, and performance tuning through CI/CD pipelines.
- Worked with the analytics team on data collection and reporting in Google Analytics and Power BI.
- **Interim Technical Team Lead (2022 – 2023):** after the CTO left, led our six-person development team. Planned projects, worked on architecture for new features, and kept existing products running smoothly.

Personal Projects *2019 – present*

- **Soul Tabletop** (2026 – present; Nuxt 4, Vue 3, TypeScript, PostgreSQL): an open-source web-based virtual tabletop that is the successor to Lantern. An in-development version is available at soultabletop.com. Users can write their own game character sheets in a custom markup language with support for formulas and dice rolls. Also includes an account system with per-resource permissions, and built-in support for the Pathfinder game system.
- **Project Comet** (2024 – present; .NET 10, C#, Unity, WebSockets): experimental backend and tooling for a small-scale MMO. Built a playable prototype with an authoritative standalone .NET 10 game server that talks to clients over WebSockets. The client is a Unity game that also runs in the browser. Successfully load-tested it with 300 simulated players on AWS. Try it at shapeland.lucyawrey.com. Earlier prototypes were in Rust.
- **Lantern** (2019 – 2024; Next.js, TypeScript, PostgreSQL, GraphQL): co-developed an early-stage virtual tabletop for the web. It is the predecessor to Soul Tabletop.
- **Other projects:** a Minecraft modpack with custom Java and Kotlin mods, a visual novel in Godot, and my Next.js portfolio site, lucyawrey.com.

EDUCATION

Eastern Michigan University *2017 – 2020*

Completed three years toward a B.S. in Computer Science

Washtenaw Technical Middle College *2014 – 2017*

High school diploma through a dual-enrollment program with Washtenaw Community College, studying computer science. Credits transferred to EMU
