SUMMARY

Full-stack software engineer with 4.5+ years of professional experience building production web apps with **C# / ASP.NET**, **Vue.js / React / TypeScript**, and **Microsoft Azure**. Took features from first prototype to production, from the database through the API to the UI, and later led a six-person team as interim technical team lead. Programming since 2014, and still building side projects to learn new tools.

SKILLS

- **Languages:** C#, TypeScript, JavaScript, SQL, HTML/CSS; also Python, Java, Rust
- **Backend:** ASP.NET / .NET, Node.js, REST and gRPC APIs
- **Frontend:** Vue.js, Nuxt, React, Next.js, Tailwind CSS
- **Data:** Azure Cosmos DB, PostgreSQL, SQLite, Google Analytics, Power BI
- **Testing & DevOps:** xUnit, Jest, Vitest, Azure App Service, CI/CD pipelines, GitHub Actions
- **AI-assisted development:** Claude Code, GitHub Copilot
- **Leadership:** technical team lead, software architecture, project planning, code review, documentation

EXPERIENCE

The Really Useful Information Company (TRUIC) *February 2019 – October 2023*

Software Engineer → Interim Technical Team Lead

- Built and maintained the internal CMS behind three public sites (How To Start An LLC, Startup Savant, truic.com), the largest with 9,000+ guides. Built with a C#/ASP.NET API, a Vue.js frontend, and Cosmos DB on Azure App Service.
- Shipped full-stack features from prototype to production, covering the data model, API endpoints, and UI.
- Built backend services for the public ASP.NET sites and their most interactive features, including a free **business logo generator**.
- Led a partial move of older JavaScript components to React and TypeScript.
- Handled Azure deployments, scaling, and performance tuning through CI/CD pipelines.
- Worked with the analytics team on data collection and reporting in Google Analytics and Power BI.
- **Interim Technical Team Lead (2022 – 2023):** after the CTO left, led the six-person development team. Planned projects, set the architecture for new web apps, and kept existing products running smoothly.

Personal Projects *2019 – present*

- **SoulTabletop** (2026–present; Nuxt 4, Vue 3, TypeScript, PostgreSQL): an open-source (MIT) tabletop RPG platform rebuilt from Lantern, now in a public soft launch at soultabletop.com. Designed the architecture and use Claude Code as a coding assistant, reviewing its work. Users write their own character sheets in a custom markup language with formulas and dice rolls. Also includes campaign roles and permissions, copyable game systems, a Pathfinder 2e importer, and Vitest tests with GitHub Actions CI.
- **Project Comet** (2024–present; .NET 10, C#, Unity, WebSockets): designing the backend for an online action game. Built a playable prototype: an authoritative .NET 10 game server that talks to players over WebSockets, and a Unity client that also runs in the browser. Load-tested it with 300 simulated players on a slow, lossy network (Docker, AWS). Try it at shapeland.lucyawrey.com. Earlier prototypes were in Rust.
- **Lantern** (2019–2024; Next.js, TypeScript, PostgreSQL, GraphQL): co-developed an early-stage virtual tabletop for the web, the predecessor to SoulTabletop. Added sign-in and database access, a GraphQL API, offline support (PWA), and strict TypeScript, plus a separate Bun/ElysiaJS API.
- **Other projects:** a Minecraft modpack with custom Java and Kotlin mods and a visual novel in Godot (both in progress), plus my portfolio site, lucyawrey.com (Next.js, TypeScript).

EDUCATION

Eastern Michigan University *2017 – 2020*

Completed three years toward a B.S. in Computer Science

Washtenaw Technical Middle College *2014 – 2017*

High school diploma through a dual-enrollment program with Washtenaw Community College, studying computer science; credits transferred to EMU
